Tips and best practices

Accessibility

Your Optimization Priorities

0/100

Set a lang for your page

#2334

Your page should define a lang attribute on the html root node: this will allow screen readers to correctly understand your website.

0/100

Specify to tags

#2380

A table represents a set of data in several dimensions. It is necessary to provide titles for each row/column, to help understanding these data.

The tag

The title of a line/a column is represented by the tag. The associated data is represented by the tag.

Here is a classic example of using the table tag:

Read the tag specifications.

You should define th tags to organize your data.

This page contains 6 table tags. No title is defined (th tags).

Did you know?

#72

■ No <noscript> tag is detected

When a web page uses scripts, it is advised to set at least one noscript tag. It is required to display a message when JavaScript is disabled by the user.

```
<script type="text/javascript">
    document.write('Hello World!')
</script>
<noscript>Your browser does not support JavaScript!</noscript>
```

Well done, these best practices are respected

▼ No empty element detected

#2569

Some tags, such as , , <button>, <legend>, <caption>, <figcaption> and <quote> elements are not allowed to be empty. Empty tag make it difficult for some screen readers to understand the page.

Either add aria-hidden attribute to the empty element or remove it from your page entirely.

Exampl

100/100

✓ No 'refresh' <meta> tag

#2395

It is not recommended to automatically force a page refresh. This behavior disturbs users who are not able to control it.

This page does not use meta refresh tag. This is a best practice.

100/100

✓ No empty "src" attribute detected

#2410

The "src" attributes link the current page to other resources. There is no justification for using them with empty values.

All your src attributes precise a target. That's a best practice.

100/100

▼ You specify a consistent label on your links

#2423

A link is more attractive if the text describes what is behind it. You can also take the opportunity to use keywords in these texts, to improve your page's SEO.

Describe the link in your <a> tag, rather than indicating the link itself. Example: My description

100/100

▼ The main title of the page is the first stated title

#2468

Facilitate the work of screen readers by indicating your main title (<h1>) before any other title.

We recommend you to keep a coherent hierarchy among your titles (h1, then h2, then h3, etc).

100/100

All labels refer to an element

#2523

The for attribute associates the label to another element of the page and help screen readers to better interpret your content.

Label and for attribute

A label describes an element (a text to fill, a checkbox, etc.). When a user clicks on a label associated with a radio button, the option will be directly selected, improving the user experience.

How to use a label?

Associate the label to an element of the page by indicating the ID of the element. Example:

<form action="/action">
<label for="myld">
<input type="radio" name="myOptions" id="myld" value="1" >

Your Optimization Priorities

0/100

Defer parsing of JavaScript

#2353

JavaScript can significantly slow down a page display, especially if it is necessary to download an external script.

Defer the use of JavaScript as much as possible to provide a faster start for the page display.

How can I fix this?

First of all, distinguish what portions of your JS is critical and must be loaded as soon as possible, and put them in a specific external file. Keep this file as streamlined as possible, and defer the parsing or execution of all other JS files.

Use one of the methods below to defer parsing for external JavaScript files:

- use the async attribute;
- use the defer attribute;
- append the script to the DOM in JavaScript during the onload event;
- make sure your scripts are placed at the bottom of the page (ideally at the end of the body).

2.1MiB of JavaScript is parsed during initial page load. Defer parsing JavaScript to reduce blocking of page rendering.

- www.youtube.com/s/[...]e.js (1.5MiB)
- www.youtube.com/s/[...]r.js (232.8KiB)
- www.googletagservi[...]0914 (109.9KiB)
- www.googletagservi[...]0914 (109.9KiB)
- googleads.g.double[...]1175 (29.8KiB of inline JavaScript)
- googleads.g.double[...]1020 (26.1KiB of inline JavaScript)
- tpc.googlesyndicat[...]9.js (15.8KiB)
- tpc.googlesyndicat[...]9.js (15.8KiB)
- tpc.googlesyndicat[...]9.js (12.1KiB)
- tpc.googlesyndicat[...]9.js (12.1KiB)
- www.youtube.com/s/[...]l.js (8.5KiB)
- www.youtube.com/em[...]19f0 (3.7KiB of inline JavaScript)
- pagead2.googlesynd[...]html (874B of inline JavaScript)

#2445

You can save 3 scripts executions

A library or an external script is usually intended to be called once per page. However, the use of widgets can lead to several useless executions.

Duplicate scripts

It is common to see scripts used multiple times on the same page. The most common cause is the integration of social network widgets. It can be useful to find them several times on the page. That is not a bad practice. However, you should be careful that those scripts don't slow down your page.

What happens when a script is included 2 times in the code? How many times is it loaded? Parsed? Executed?

Most modern web browsers download only once a script included 2 times. An exception persists: Firefox, which will load the resource as many times as mentioned if no effective caching policy is configured.

Apart from this exception, performance issues come during the parsing and execution of the scripts. Indeed, if a script is placed three times in the code, it will be parsed and executed 3 times, on all browsers.

Do not hesitate to read this article on that topic.

How to fix it?

There is a solution to use a script several times without parsing and executing more than once. You need to write some JavaScript code that checks if the script is present. If the script is already included, it just uses it, otherwise it injects it and uses it.

Consider the following example with the Facebook widget, described in the article. Whenever you want to integrate this functionality into your page, it is necessary to include the following code:

```
(function(d, s, id){
  var js, fjs = d.getElementsByTagName(s)[0];
  if (d.getElementById(id)) {return;}
  js = d.createElement(s); js.id = id;
  js.src = "//connect.facebook.net/en_US/sdk.js";
  fjs.parentNode.insertBefore(js, fjs);
}(document, 'script', 'facebook-jssdk'));
```

The bold line checks the presence of the script in the document. So the script is included, parsed and executed only during the first call in the page. Other calls will fall in the case of the bold line, and therefore will just use the script that is already included and executed.

The following scripts are parsed and executed several times on your page:

- adservice.google.com.br/adsid/integr[...]twebsiteever.com (parsed and executed 2 times)
- adservice.google.com/adsid/integrato[...]twebsiteever.com (parsed and executed 2 times)
- //pagead2.googlesyndication.com/pagead/js/adsbygoogle.js (parsed and executed 2 times)

#2356

Specify a character set in the response HTTP Header

The following resources have no character set specified in their HTTP headers. Specifying a character set in HTTP headers can speed up browser rendering.

Resources from "theworldsworstwebsiteever"

www.theworldsworst[...]com/

Resources hosted by a third-party

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

• tpc.googlesyndicat[...]html

Specify the character set used in the **Content-Type** HTTP header allows the browser to parse immediately the page. For example: content-type: text/html;charset=UTF-8.

When the browser receives bytes from your server, it needs to identify the collection of letters and symbols that were used in writing the text that was converted into these bytes, and the encoding used for this conversion, in order to reverse it. If no information of this kind has been transmitted, the browser will try to find recognizable patterns within the bytes to determine the encoding itself, and eventually try some common charsets, which will take time, delaying further processing of the page.

How to specify a charset in the Content-Type header?

In the following explanation, we will consider UTF-8 as the targeted character set but please remember that the character set declared in your Content-Type HTTP Header must reflect the character set used to encode the file, which may not be LITF-8

On **Apache 2.2+**, the configuration of UTF-8 as a default character set for your text/plain and text/html files involves the AddDefaultCharset directive:

AddDefaultCharset directive:

AddDefaultCharset utf-8

For other types of files, you'll need the AddCharset directive:

AddCharset utf-8 .js .css ...

Example

On nginx, you'll need to make sure that the ngx_http_charset_module is loaded, then use the charset directive.

charset utf-8;

Example

Here too, it is possible to refine the scope so that other types of files than text/html are delivered in utf-8, using the directive charset_types:

charset_types text/html text/css application/javascript

Examp

The other tips

Avoid http-equiv <meta> tags

#2405

HTTP headers are more efficient than the http-equiv meta tags.

The <meta http-equiv=""/> tags

The http-equiv meta tags provide the web browser with information similar to HTTP headers. For example, defining the meta <meta http-equiv="content-type"/> is the same as sending the HTTP Content-Type header.

There are two disadvantages in using http-equiv meta tags:

- Going through the meta requires to interpret the beginning of the HTML page, which is slower than going through the HTTP headers in terms of performance
- If the HTTP header is already present, the meta is ignored

In which cases are the <meta http-equiv=""/> useful?

Only one case can justify the presence of these meta tags: if you don't have access to the configuration of your server, and that is to say to the HTTP headers.

However, we recommend that you use a configurable server so that you can establish the most efficient site possible.

This page contains 16 http-equiv meta tags. If possible, you should replace them:

- origin-trial
- origin-trial
- origin-trial
- origin-trial
- and 12 others

Well done, these best practices are respected

100/100

▼ Your HTML response is not too heavy

#2566

Why reduce the code amount of a page?

Before a web page can be displayed, the browser must, among other things, download it, parse it and model it into a document that can be understood by the rendering engine. If the amount of code contained in the page is too large, these steps are slowed down and the rendering is delayed.

How to reduce the amount of code?

Your HTML response should contain only the information that is immediately necessary to display the visible area of the page. Move inline information to external files (JS for scripts, CSS for styles, asynchronous queries for additional content) and simplify the HTML structure of your page.

▼ No Mutation Events detected in your scripts

#2575

To capture DOM events, do not use Mutation Events. Alternatives exist.

Good concept, bad implementation

When developing complex JavaScript applications, you may need to know when the DOM node tree has changed. Introduced in 2000 in the DOM, Level 2 specification to provide a solution to this need, Mutations Events are browser-initiated events that let you know when a DOM node is added, removed, or deleted.

Mutation Events, however, present major performance problems. First, they are synchronous, i.e. they prevent other events in the queue from being fired (if those events are used to update the UI, this will cause some lag). Second, they are implemented as browser events, thus traverse the DOM tree from the targeted HTML element to the parent element which listens for the event, clogging the JavaScript thread along the way.

Mutation Events have been deprecated in 2016 in the DOM, Level 3 specification.

Mutation Observers to the rescue

If you need to watch for changes being made to the DOM tree, you should use the MutationObserver interface (DOM4 Living Standard). Mutation Observers are asynchronous, processed in batches, and observe specific or all changes to a node. They are more efficient in terms of CPU usage than browser events and therefore cause fewer to no UI freeze.

Learn how to use Mutation Observers (Mozilla Developer Network).

✓ You are using persistent connections

#2355

In HTTP/1.1, each resource is downloaded over a dedicated connection (TCP). Some headers can indicate to the browser that it can reuse the same connection multiple times, which improves performance.

The HTTP Keep-Alive headers

The Connection and Keep-Alive HTTTP headers inform the browser how it can keep a TCP connection (enabled by default with HTTP 1.1) open and reuse it for future requests.

For these persistent connections to be enabled, the Connection header must be set to keep-alive. The Keep-Alive header must indicate the minimum time during which the connection must remain open and the maximum number of requests to answer to. For example:

Connection: Keep-Alive
Keep-Alive: timeout=5, max=1000

indicates to the browser that the connection must remain open for at least 5 seconds and answer, at most, 1000 requests.

Non an Apache server, you can enable both headers from your.htaccess file, defining the connection as keep-alive.

If you have access to the Apache configuration, you can more precisely define the different values (note: you will have to restart the web server).

To enable Keep-Alive connections, "On".

To disable, "Off".

KeepAlive On

MaxKeepAliveRequests: the number of requests allowed per connection.

If it is set to 0, unlimited requests will be allowed.

We recommend that this setting be kept to a high value for maximum

server performance.

MaxKeepAliveRequests 1000

KeepAliveTimeout: The number of seconds Apache httpd will wait for a

subsequent request before closing the connection.

Setting too high of a value may cause performance problems in heavily

loaded servers.

KeepAliveTimeout 5

100/100

You do not use CSS @import

#2370

Using CSS @import allows to add external stylesheet. In fact, browsers cannot download them at the same time, this may add a delay to the rendering of the page. It is better to use the link tag. See more information.

100/100

This page uses an appropriate number of DOM elements

#2416

The number of DOM elements influences the complexity of the webpage and DOM access in JavaScript.

A well-designed webpage can offer rich content while maintaining a reasonable number of DOM elements. Read more about this here.

We recommend creating pages that contain less than 1000 DOM elements.

There are 269 DOM elements on this page.

▼ The page doesn't use client-side redirection

#2539

No client-side redirection (window-location, meta refresh...) has been triggered to display the page. Client-side redirections are to be avoided in any way possible.

100/100

▼ Your scripts seem to be injected efficiently

#2550

The script injection through the document.write instruction delays the rendering of your page and/or the interactivity for the user.

Do you need to inject a script?

document.write is sometimes used to inject a script. That is a bad practice. Example:

```
document.write('<script src="" + src + "" type="text/javascript"><\/script>');
```

As described in this article, you should prefer the "createElement-insertBefore" pattern:

```
var sNew = document.createElement("script");
sNew.async = true;
sNew.src = "http://ajax.googleapis.com/ajax/libs/jquery/1.5.1/jquery.min.js";
var s0 = document.getElementsByTagName('script')[0];
s0.parentNode.insertBefore(sNew, s0);
Example
```

On this page, no document.write injects a script.

Your Optimization Priorities

90/100

✓ 10 requests from third parties don't adopt a far future cache policy

#2437

Defining several days of cache retention for your static resources will reduce the load on your server.

The Expires header explained

Some of your resources use the Expires HTTP header to get an effective caching policy—this is a best practice. However, you should consider improving its configuration to make the most of the caching mechanisms. Here is an example of the Expires HTTP header:

Expires: Thu, 25 Dec 2014 20:00:00 GMT

Example

When you **deploy a new version of your website, remember to rename static resources** that have been modified. If you do not change their names, your users will keep resources corresponding to the old versions stored in their caches, and they may find themselves on an unstable version of your page. For example:

myresource.min.20140101.js

Example

Read the Yahoo! guidelines on this subject.

Recommended Expires header setting

We recommend setting the Expires HTTP header, so the date is between 2 days and 1 year.

This page contains 10 resources that do not have a far expiration date:

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

- https://www.googletagmanager.com/gtag/js?id=UA-46911809-1
- https://pagead2.googlesyndication.com/pagead/js/adsbygoogle.js
- https://platform.twitter.com/widgets.js
- www.googletagmanager.com/gtag/js?id=G-N[...]9&l=dataLayer&cx=c
- https://www.google-analytics.com/analytics.js
- www.googletagservices.com/activeview/js[...]js?cache=r20110914
- https://i.ytimg.com/vi_webp/9bZkp7q19f0/sddefault.webp
- https://www.gstatic.com/cv/js/sender/v1/cast_sender.js
- cdn.syndication.twimg.com/timeline/prof[...]with_replies=false
- https://tpc.googlesyndication.com/sodar/sodar2.js

Well done, these best practices are respected

✓ You do not use too long inline scripts

#70

Any script with a significant size should let the browser cached them in order to reduce loading time/improve performance of your returning visitor.

Inline scripts / cache policy

"inline" scripts allow to integrate easily small portions of scripts directly in the HTML code. Example:

```
<script type="text/javascript">

(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']...,'/analytics.js','ga');
ga('create', 'UA-11111111-1', 'mywebsite.com');
</script>
```

By doing so, you avoid making a request to the server to retrieve the resource. So inline scripts represent a performance gain if you want to integrate small scripts.

However, once a script has a fairly substantial size, we advise you to outsource it and perform a request to retrieve it. So you will benefit from the cache mechanism.

What should I do?

Outsource your scripts with more than 1500 characters in one or more separate files.

100/100

▼ The 'Vary: Accept-Encoding' header is defined

#2352

The following publicly cacheable, compressible resources should have a "Vary: Accept-Encoding" header:

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

- cdn.syndication.tw[...]alse
- static.doubleclick[...]s.js
- syndication.twitte[...]31af

The Vary: Accept-Encoding header allows to cache two versions of the resource on proxies: one compressed, and one uncompressed. So, the clients who cannot properly decompress the files are able to access your page via a proxy, using the uncompressed version. The other users will get the compressed version.

#2425

You specify resource cache expiry headers

Cache headers (Cache-Control , ETag , formerly Expires) are essential for an effective cache policy, and will greatly impact the loading time of your pages during future visits.

The Cache-Control header

Each resource can define its caching rules via the Cache-Control HTTP header. The max-age property defines the duration of the caching (in seconds), and can be accompanied by instructions for caching resources on proxy servers, located between the browser and the server issuing the resource.

The following header indicates that the response can be cached on proxy servers and on the browser (public, as opposed to private where only the browser is allowed to do the caching) for two hours:

Cache-Control: private, max-age=7300

xampl

If some of your resources do not need to be cached, you can also indicate this explicitly:

Cache-Control: no-store

Example

The **Expires** header

Expires is the earliest HTTP header for managing resource caching, and will help you manage the cache for browsers that do not support Cache-Control.

When using the Expires header, you can define an expiry date for each resource: as long as the date has not expired, the browser will either store or use the resource stored in the cache.

The expiry date of the resources is set using the **Expires** HTTP header:

Expires: Thu, 25 Dec 2014 20:00:00 GMT

Exampl

You can specify a long expiry date for static resources (maximum 1 year), and a shorter expiry date for resources that may change (minimum 48 hours).

Reassessment of resources when the cache expires

If no cache policy is set for a resource or the duration of its caching is exceeded, the browser makes a new request to download a required resource.

To prevent the browser from downloading a resource that has not been modified since it was cached, use the ETag HTTP header. Each version of a resource can be associated with a validation token. When a resource's cache expires, the browser will ask the server again for the resource, passing this token with the If-None-Match HTTP header containing the token value. The server will compare its version of the token with the one provided. If the resource has not been modified, the server will allow the browser to renew the caching of the resource without downloading the resource again, via an 304 "Not Modified" HTTP response.

Deliberate cache invalidation

When releasing a new version of your site, remember to rename static resources that have been modified (versioning), in order to force browsers to download these new versions, instead of using cached resources, to prevent users from finding themselves in an unstable version of your page. For example:

maressource.min.20140101.js

Exampl

To learn more about HTTP caching, please see ${\it Google's}$ recommendations.

Congratulations! Your resources are cached.

Well done, these best practices are respected

100/100

✓ No frameset, frame and noframes tags detected

#80

These tags are obsolete, due to several issues related to the navigation consistency, SEO or browsers' bookmark features for example.

None of these tags is detected on this page.

The use of the iframe tag is prefered.

100/100

✓ No Java applets detected

#82

Java applets are considered obsolete in 2015. HTML5 is powerful and more widely supported. Using Java applets can lead to compatibility issues and may send negative signals to your users (e.g. the browser indicating that content was blocked because it could be dangerous).

Congratulations, this page doesn't contain Java applets.

100/100

✓ Do not use
bgsound> tag

#89

No bgsound tag detected. This is a good practice: this element is not a HTML standard. See more information.

Use the audio tag to deliver audio content on your page.

```
<audio src="my-audio-file.ogg" autoplay>
Your browser doesn't support the audio element.
</audio>
```

100/100

✓ You do not use links to Word documents

#99

.doc and .docx documents do not guarantee compatibility with all major operating systems. It's recommended to use PDF documents.

This page contains only standard links.

100/100

▼ No deprecated attributes are detected in the <body> tag

#2382

Some layout attributes are deprecated in HTML 5: alink / background / bgcolor / link / text / vlink

Congratulations, this page doesn't use deprecated attributes in the body tag.

Prefer using CSS instructions instead.

No BOM (Byte Order Mark) detected

#2424

Some parsers are not able to interpret a page with a BOM in it.

What is the BOM?

The BOM is a hidden character located at the beginning of the page, aiming at helping to determine what encoding the page uses. But the best practices of the web prompt the use of the HTTP Content-Type header to define the encoding used by the page. The BOM has no reason to be in this context.

Apart from the fact that this type of indicator is useless on the web, it can lead to a certain number of issues. This is the case for example of the W3C validation that is going to try to interpret the first character which corresponds to the BOM. Then, the document will not be valid.

No resource uses a BOM.

100/100

No Flash resource detected

#2488

Flash is considered obsolete in 2015. HTML5 is more powerful and more widely supported. Using Flash can lead to compatibility issues and may send negative signals to your users (eg the browser warning that content was blocked because it could be dangerous).

Moreover, Google shows directly in its mobile search results that the page may not work on the user's device.

Congratulations, this page doesn't contain Flash resources.

100/100

▼ Silverlight plugin is not used

#2493

Silverlight plugin is considered obsolete in 2015. HTML5 is more powerful and more widely supported. Using Silverlight plugin can lead to compatibility issues and may send negative signals to your users (e.g. the browser indicating that content was blocked because it could be dangerous).

Congratulations, this page doesn't use Silverlight plugin.

100/100

Your font formats are well used

#2496

Be sure to deliver the most suitable font format for each platform.

Declaring several font formats

The web browsers (Firefox, Chrome, Safari, Internet Explorer, Opera ...) do not support all the same font formats. Your goal is to use the lightest possible format for each platform. When you use a font, you can specify several formats, via the @font-face CSS instruction: so the browser will use the first compatible format that it supports.

How to declare your font formats?

Check if your formats are well ordered in the <a>@font-face 's <a>src property. Here's the order to respect for your webfont formats: EOT, WOFF2, WOFF, TTF, and SVG.

All fonts are well ordered in the <code>@font-face</code> instructions.

Your Optimization Priorities

0/100

Some resources are too heavy

#2421

This page contains a file with a size greater than 1MB:

• https://www.theworldsworstwebsiteever.com/img21/hot-dog.png (1.4MB)

Too heavy files should not be loaded on a web page. Be sure you need this resource to load the page. You should probably consider some of the following actions:

- the file uses a PNG format. You should try to convert it to a JPEG file
- resize the images to fit the display size
- compress the resource
- load the resource asynchronously

0/100

#2443

Reduce the page weight (4.4MB)

The page weight is too high, slowing down its display, especially on low-speed connections. This can lead to frustration for users paying for data (see whatdoesmysitecost.com).

Evaluate the Weight of my Web Page

According to HTTPArchive, in July 2019, the average weight of a web page is 1,95MB.

How to reduce the weight of my page?

You can report to our "Data amount" category to discover the possible optimizations in your case. Images are often involved.

Moreover, make sure to build your web pages to load data that is essential to the user experience (rendering optimization of the critical path).

For other content (social networking plugins, advertising, content at the bottom of the page ...), it is better to delay the loading (asynchronous, lazy-loading ...), so they don't override priority contents.

We have established the weight distribution of the page by resource type:

Images: 60,50% of total weight
JavaScript: 28,05% of total weight
Texts: 6,65% of total weight
Others: 1,51% of total weight
CSS: 1,42% of total weight
Font: 1,02% of total weight
JSON: 0,81% of total weight

Here is the weight of the 10 heaviest resources over the network, and that are necessary to load the page:

- https://www.theworldsworstwebsiteever.com/img21/hot-dog.png (1.4MB)
- https://www.theworldsworstwebsiteever.com/img21/llama.jpg (570kB)
- www.youtube.com/s/player/577098c0/pl[...]et/pt_BR/base.js (537kB)
- https://www.theworldsworstwebsiteever.com/img21/old.jpg (199kB)
- www.theworldsworstwebsiteever.com/im[...]errible-poll.jpg (116kB)
 pagead2.googlesyndication.com/pagead[...]s_impl_fy2019.js (109kB)
- pageauz.googlesyndication.com/pageau[...]s_impi_iyzo19.js (109kB)
 platform.twitter.com/widgets/widget_[...]twebsiteever.com (106kB)
- https://www.theworldsworstwebsiteever.com/img21/maga.png (92kB)
- www.youtube.com/s/player/577098c0/ww[...]-embed-player.js (88kB)
- https://www.theworldsworstwebsiteever.com/img21/heyya.mp3 (66kB)

0/100

Optimize your images

#2389

Properly formatting and compressing images can save many bytes of data.

Optimize the following images to reduce their size by 444.1KiB (22% reduction).

- Losslessly compressing www.theworldsworst[...].png could save 352.4KiB (26% reduction).
- Losslessly compressing www.theworldsworst[...].jpg could save 49.3KiB (9% reduction).
- Losslessly compressing www.theworldsworst[...].jpg could save 38.5KiB (35% reduction).
- Losslessly compressing www.theworldsworst[...].jpg could save 2.9KiB (10% reduction).
- Losslessly compressing www.theworldsworst[...].gif could save 1.0KiB (19% reduction).

Images may contain data unnecessary for their use on the web. This data can increase their size significantly. Some tools automatically remove this unnecessary data without loss of quality and thus reduce your image sizes.

Many image optimization algorithms depend on each image format. Some of them are included in graphic software like Photoshop or GIMP:

- PNG: Zopfli-png, PNGOUT, OptiPNG, AdvPNG, PNGCrush, PNGQuant...
- JPG: JPEGOptim, MozJPEG, Jpegtran, Guetzli...

FileOptimizer (Windows), ImageOptim (Mac) or Trimage (Linux) are software that combine several algorithms in one place. They will find the best possible optimization and encoding for every image, with or without quality loss.

The other tips

#2436

1 image is resized on browser side

If your images are larger than their display area, the browser will download unnecessary data (and perform unsupervised resizing).

Avoid resizing images on the browser side

Resizing images on the browser side to reduce their rendering size is not recommended.

When the browser needs to display an image on your page, it does everything it can to adapt it to its rendering surface. If the image is too large, it will reduce it.

Provide images adapted to the display dimensions to prevents unnecessary data from being sent over the network, which reduces page loading time.

And because embedded browser algorithms are not as good as those of image manipulation tools, you will get a more satisfying visual result by resizing your images upfront, rather than letting the browser do it.

Serve Responsive Images

Several methods exist, to serve images adapted to the browser regardless of screen resolution or device pixel density. We recommend reading the following resources:

- "Responsive images" on the Mozilla Developer Network
- Picturefill, to start using the <picture> element in browsers that do not support it
- RICG, group of developers working on responsive images

Don't resize the following image:

• www.theworldsworstwebsiteev[...]/llama.jpg (displayed size: 282x246)

On this page, 1 image is resized by less than 40%. Several Responsive Web Design techniques are based on resizing images that are close in size to their respective rendering areas. Such resizing may therefore be appropriate, and we do not penalize them. However, we invite you to ensure that these do not affect the performance of the page:

• www.theworldsworstwebsiteev[...]21/old.jpg (displayed size: 829x645)

1 20 images (2.4MB) are loaded too early

#2446

Load images above the fold line first, that means all the images that are visible without any scroll of the page by the

Webpage and images

Images commonly represent more than 60% of the total weight of webpages. By loading initially the only images that are visible without page scrolling, you'll reduce bandwidth consumption as for your server and your visitors. If an image has to display after any visitor's action (as scrolling), then you'd better load it on demand, when necessary (lazyloading).

How to set up lazyloading?

You can get information concerning the features and plugins proposed by your page's frameworks/CMS. You should find some easy-to-set solutions.

If you have to implement lazy-loading yourself, the simplest way may be to activate the native feature introduced by Chrome in 2019: on all targeted images, add loading="lazy". The feature is implemented by recent browsers or will be in the near future. In the meantime: on browsers that don't support native lazy-load, the attribute will have no effect.

Native lazy-loading, however, is the solution that offers the least control, and is sometimes far too eager, loading images that do not require to be loaded so soon (read more).

Some Javascript libraries could help you implement lazyloading with more granularity.

On this page, 20 images can be lazyloaded.

- https://www.theworldsworstwebsiteever.com/img21/firefox-3.jpg
- https://www.theworldsworstwebsiteever.com/img21/1.gif
- https://www.theworldsworstwebsiteever.com/img21/terrible-poll.jpg
- https://www.theworldsworstwebsiteever.com/img21/7.gif
- https://www.theworldsworstwebsiteever.com/img21/2.gif
- https://www.theworldsworstwebsiteever.com/img21/hot-dog.png
- https://www.theworldsworstwebsiteever.com/img21/llama.jpg
- https://www.theworldsworstwebsiteever.com/img21/old.jpg
- https://www.theworldsworstwebsiteever.com/img21/arrow-new.gif https://www.theworldsworstwebsiteever.com/img21/2_workers.gif
- and 10 others

If the early loading of some of these images is justified, although they are not immediately visible, you can add the attribute loading="eager" to them, which clearly specifies this behavior.

90/100

Minify HTML

#2364

Compacting HTML code, including any inline JavaScript and CSS contained in it, can save many bytes of data and speed up download and parse times.

Minify HTML for the following resources to reduce their size by 3.0KiB (8% reduction).

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

• Minifying googleads.g.double[...]1425 could save 3.0KiB (8% reduction).

Minify JavaScript

#2388

Compacting JavaScript code can save many bytes of data and speed up downloading, parsing, and execution time.

Minify JavaScript for the following resources to reduce their size by 8.3KiB (2% reduction).

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

- Minifying www.youtube.com/s/[...]e.js could save 4.7KiB (1% reduction).
- Minifying pagead2.googlesynd[...]9.js could save 3.6KiB (4% reduction).

There are many tools to minify JavaScript files. You can try YUI Compressor or JSMin, recommended by Google.

#2415

1 2 domains send 935 bytes of cookies

HTTP cookies are used to track a user to costumize the page according to their profile. They are sent as a HTTP header from the web server to the browser. Then, each time the browser accesses to the server, it sends a request containing the cookie received at the first response. See more information.

Here, 2 domains send 935 bytes of cookies:

Domain name: theworldsworstwebsiteever

- _ga_NXFW7VQ139 : 429 bytes distributed on 13 request(s)
- ga: 351 bytes distributed on 13 request(s)
- <u>gads</u>: 100 bytes distributed on 1 request(s)
- _gid : 27 bytes distributed on 1 request(s)
- _gat_gtag_UA_46911809_1 : 1 bytes distributed on 1 request(s)

Domain name: casalemedia

- CMID: 24 bytes distributed on 1 request(s)
- CMPS: 3 bytes distributed on 1 request(s)

Well done, these best practices are respected

100/100

All your resources are served from a consistent URL

#2325

Resources with identical content should be served from the same URL to avoid duplicate downloads and additional requests.

Different URLs for the same resource

If you use different URLs to serve identical content, browsers have to request this content from the server several times, and your page will trigger unnecessary requests for data. If the same URL is used, the browser will only send one request and will use the response wherever the resource is requested. You should also use the same URL to reference the same content on several pages to benefit from the cache mechanism.

How to fix this?

Serve each resource from a unique URL. If you have to request the same resource several times, the same URL should be used to retrieve it every time.

100/100

Compression is enabled

#2384

You have compression enabled. Learn more about enabling compression.

▼ Your CSS resources are minified or don't need to be

There are many tools to minify CSS files. You can try YUI Compressor or cssmin.js, recommended by Google.

100/100

✓ 11 static resources contain 297 bytes of cookies

#2414

You send some unnecessary data on the network through cookies on static resources.

Cookies and static resources

Cookies are used to customize the content of a page depending on the user profile. There is no need to send this kind of information when requesting resources that deliver always the same content (static resources).

The requests to images, JavaScript or CSS resources do not need to use cookies.

How to fix the issue?

Do not use cookies on static resources requests. However, some domain names require the sending of cookies on all resources. In that case, you can create another domain name that will deliver your static resources. Example: static.mydomain.com

You should stop serving the following resources with cookies:

- www.theworldsworstwebsit[...]21/0.gif (27 bytes of cookies)
- www.theworldsworstwebsit[...]21/2.gif (27 bytes of cookies)
- www.theworldsworstwebsit[...]tars.gif (27 bytes of cookies)
- www.theworldsworstwebsit[...]on-1.gif (27 bytes of cookies)
- and 7 others

100/100

7 images use the PNG format in the right way

#2461

The choice of the right format for an image allows to reduce its weight.

The PNG format

The PNG image format is intended to the images requiring the transparency, or else to the small images having little details and colours.

Prefer the JPEG format...

The main problem of PNG format is to not support quality loss. Indeed, a format such as JPEG offers to "downgrade" the quality of the image without being perceived by the user. Doing so, you can reduce the quality of the image of about 25% whithout the user realizes it.

An image with an consequent weight will be therefore better compressed by using the JPEG format.

...or the PNG-8 format

In the case where your image necessarly requires using the transparency mecanism, not borne by the JPEG format, you should convert your "standard" PNG image, into PNG-8. This format, based upon a 256 color palette maximum allows to decrease the weight of the image whithout significantly affecting its overall quality. Tools such as pngquant or else tinypng will suport you in this procedure.

At last, if the quality given by the PNG-8 format is not appropriate for your image, you can get information on the possible advanced technics to get this behaviour without having an image in PNG format. For example, it is possible to halve your image in 2 JPEG images, one including the transparency data and the other one including the data related to the colours, and to gather the image on the customer's side with a CANVAS element.

For further information, please visit this article about image compression.

The choice of the PNG format on the images of this page doesn't have negative effect.

100/100

√ 18 image(s) use the GIF format properly

#2465

Choosing a suitable format can dramatically reduce the weight of an image.

The GIF format

The GIF format is suitable for small animated images (< 100kb). If you do not use animation, the PNG and JPEG formats will be more suitable and lighter, once optimized. Replace each animated content with an <wideo> element containing an MPEG-4/H.264 < source>.

```
<video loop="loop" poster="video_poster.jpg">
<source src="video.mp4" type="video/mp4">
</video>
```

Exemp

The GIF images of this page have not a negative impact.

100/100

▼ Redirects are lightweight

#2486

An HTTP redirect's content is not used by web browsers. So, it provides an unnecessary weight that should be as small as possible.

Redirects on the web

Redirects can be temporary (302 HTTP code) or permanent (301).

This mechanism is for example used for secondary domains (.net to .com), the language detection mechanisms, etc.

How to fix the issue?

First, ensure that the redirect is unavoidable. In this case, it is necessary to reduce or completely remove the contents of the server responses for redirects.

A redirect should be < 1kB.

There isn't too heavy redirect.

▼ HTTP error responses are lightweight

#2487

The content of a HTTP error response is not used by web browsers. So, it provides an unnecessary weight that should be as small as possible.

Responses in error on the web

The resources that can be reached by the browser return a HTTP code between 400 and 599.

How to fix the issue?

First, you have to avoid requesting resources that return an error. Moreover, reduce or completely remove the contents of the server error responses.

A response error should be < 10kB.

There is no heavy resource in error.

100/100

▼ The favicon is lightweight

#2490

The favicon must be as lightweight as possible.

The favicon on the web

This small image allows you to display a logo on the browser tabs for instance.

How to fix the issue?

A favicon should be < 10kB.

The favicon (https://www.theworldsworstwebsiteever.com/favicon.ico) isn't too heavy (4kB).

pixel.rubiconproject.com	1011	691	0	1
static.doubleclick.net	380	229	1	1

Well done, these best practices are respected

✓ No redirect detected

#2339

The redirects trigger avoidable roundtrips on the network and increase the page loading time.

HTTP redirects

The HTTP redirects inform the browser that the desired content is accessible from a different URL. They trigger a new HTTP request to retrieve the target resource and return an HTTP code between 300 and 399. See the specifications of HTTP redirects.

How to solve the issue?

Allow the user to directly access your content without redirects, or determine and improve what causes these excessive loading times on your redirects. See recommendations from Google.

This page does not use redirects before accessing the right content.

100/100

Only reachable resources are requested

#2344

You should avoid requesting unreachable resources.

All of the page's resources are reachable.

These errors can affect content on and behaviors of your website and cause unnecessary network traffic, which affects the loading time of your page.

100/100

✓ You do not use too much "prefetch" on the links

#2403

No resource is prefetched on this page.

You should limit the number of prefetched requests to avoid network congestion. Identify your users' behavior to prefetch the most requested resources.

Note that some browsers automatically block the number of prefetched resources. For instance, Internet Explorer 11 limits this mechanism to 10 requests.

100/100

Your JavaScript files are well distributed

#2418

Each HTTP request affects the performance of your webpage (e.g., roundtrip time and bandwidth usage).

For example, it is better to request a unique 50 kB file instead of requesting 10 files that are 5 kB in size.

How should I distribute scripts?

Distribute your scripts by integrating them directly into your HTML or grouping them in files. We recommend using the latter method to take advantage of caching mechanisms.

You make requests to JavaScript files wisely.

✓ Your CSS files are well distributed

#2419

Each HTTP request affects the performance of your webpage (e.g., roundtrip time and bandwidth usage).

For example, it is better to request a unique 50 kB file instead of requesting 10 files that are 5 kB in size.

How should I distribute styles?

Distribute your styles by integrating them directly into your HTML or grouping them in files. We recommend using the latter method to take advantage of caching mechanisms.

You make requests to CSS files wisely.

100/100

You use CSS sprites

#2442

Combining images into CSS sprites reduces the number of files the browser has to download and accelerates the loading time.

CSS sprites explained

A CSS sprite is a single file in which several smaller images are grouped and positioned one beside the other. You can display each small image in your page by applying CSS styles, and a single request is necessary to recover all the images. Use this method only for small images, such as icons, so the CSS sprite is not too heavy.

Here is a CSS sprite example :

The page also applies the styles associated with the sprite:

```
.sprite {
  background-image: url(img/sprite.png);
  background-repeat: no-repeat;
  display: block;
}
.sprite-browsers-firefox {
  width: 31px;
  height: 28px;
  background-position: -74px 0;
```

Then you have just to define the right class in your HTML file, and the icon appears:

```
<span class="sprite sprite-browsers-firefox"></span>
```

How should I create CSS sprites?

Their creation can be complex, so we recommend using tools that easily generate them for you. Here are a few sprite generators:

- https://draeton.github.io/stitches/
- http://spritegen.website-performance.org/

✓ None of your images uses only one color

#2466

One request to an image composed of a unique color unnecessarily increases the data amount transmitted on the network.

Fetching an image composed of a single color is useless. CSS styles can achieve the same result in a more efficient way.

For instance, to draw a simple circle, you can use the following code:

```
#myElement {
background:#ff0000;
border-radius:50%;
width:160px;
height:160px;
}
```

All the images of this page are composed of several colors.

Your Optimization Priorities

0/100

Separate the CSS styles from the HTML tags

#2383

Separating HTML tags and CSS directives improves code readability and promotes factorization.

How to define CSS styles

CSS styles are used to format the page. You can use one of three main methods to define them:

- declare styles in a specific CSS file;
- declare "inline" styles (<style> tag in your HTML template);
- declare styles with the "style" attribute of a HTML tag.

How can I improve my page?

We recommend grouping your CSS styles in <style> tags or in separate files. That way, the HTML is only responsible for providing the structure of the page, and its layout is outsourced. The <style> attribute should only be generated by some JavaScript code (e.g., if you need to know the screen size).

This page uses 50 style attribute(s):

- <body style="background-image: url('img21/newbkg.jpg')">
- <div style="color: white;">
- <div style="width: 1400px">
- <h1 style="font-family: 'Brush Script MT', Brush Script, Times, Time New Roman, serif; font-size: 325%;">
- and 46 others

Well done, these best practices are respected

100/100

✓ No nested tables detected

#79

table tag should only be used to render ordered data. Handle the elements layout with CSS instructions.

You can use colspan and rowspan properties to represent complex data.

No nested table found in this page.

100/100

You provide a favicon

#2379

Well done, you defined a favicon on this page.

Favicon is a small image providing an icon to a website. It's located in the root of your server and the browser will always request it. It is better not to respond with a 404 HTTP code (not found).

Moreover, this file will be asked on every requested web page, so make it cacheable: the client will request it only once. See more information.

✓ You do not gzip/deflate PNG images

#2398

Compression has a cost, on the server and the client browser. You should enable it only if it is effective.

PNG and compression

PNG images does not support gzip compression. It is useless to perform compression operations on server side, and decompression on client side for this kind of files.

This page does not compress images. This is a best practice.

100/100

The extensions of your resources are consistent

#2448

The extension of a resource allows to identify easily its content type. You have no reason to indicate a different extension of the actual content type of the resource.

For instance, the file resource.js must use a Content-Type HTTP header equal to application/javascript. You can check the Content-Type HTTP header value using a debugger tool (e.g.: DevTools on Chrome).

100/100

1 resource does not define its content type

#2449

Each resource should define its content type in order to facilitate their interpretation by web browsers.

You have no reason to hide the type of a resource.

We advise you to set the "Content-Type" HTTP header on every resources of the page.

1 resource should define its content type:

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

cc.adingo.jp/adx/push/?google_[...]YquuuRS1DaG4

100/100

IDs within your HTML code are unique

#2491

Using the same ID on several elements can have side effects, especially during JavaScript executions or when applying CSS rules.

IDs explained

Each element of a web page can be identified thanks to the id attribute:

```
<span id="mySpan1"></span>
```

These IDs allow you to manipulate your elements with CSS or JavaScript instructions.

How to properly use IDs?

You must ensure identifiers are not duplicated within the page. If you want to share a property or a behavior between multiple items, you have to use the class attribute, which is dedicated to this purpose:

```
<span class="mySpans"></span><span class="mySpans"></span><</p>
```

✓ No CSS property is overridden by a shorthand

#2515

CSS has some pitfalls that can cause side effects on your styles.

Override CSS properties

When a property is used 2 times within a CSS rule, the second one overrides the first.

CSS provides some shorthand properties, that can lead to some mistakes. For instance, the "border" property is applied to all borders of an element, avoiding the use of all "border-top", "border-right", "border-left" and "border-bottom" properties.

For instance:

```
.myClass {
    border-color:red;
    border:5px solid; // border will take again the default color
}
```

"border-color" is overridden by the "border" shorthand property.

Avoid side effects

The use of shorthand properties is risky, because it comes with an implicit override. If the resulting style on your page is the desired one, you should delete the overridden property (it will also reduce the file size).

100/100

✓ Your CSS selectors are not too complex

#2516

Using simple CSS selectors improves your code's readability and performance.

CSS rules

The CSS rules allow to select elements from the HTML code, and to apply layout properties.

They use selectors (identifiers, classes, tag names, etc.) for selecting the HTML elements. A well-structured page allows writing simple CSS rules, quickly readable and efficient.

How to improve it?

Simplify your selectors as much as possible. Do not hesitate to introduce new classes in your code to avoid complex selectors.

For instance, the following selector:

```
body td .myClass div .myClass2 span .myClass3 {}

Should be replaced by:

#myld .myClass3 {}

Example
```

100/100

The !important declaration is not used

#2517

If you abuse of this declaration, you should consider a review of your CSS code. We tolerate 10 occurrences of the !important declaration before penalizing your score.

CSS properties are not duplicated

#2527

Using several times the same property within a same CSS rule can affect the readability of the CSS. It is also an optimization opportunity: by removing duplicated properties, you will reduce the file size.

CSS properties

The CSS properties allow to apply a style to a set of elements. It is unnecessary to define 2 times the same property with the same value in a same rule.

How to improve it?

Remove one occurrence of the duplicated property. For example, the following properties:

```
.myClass {
margin: 10px;
...
margin: 10px;
}
```

Should be replaced by:

```
.myClass {
 margin: 10px;
}
```

100/100

▼ Your CSS selectors are unique

#2556

Using several times the same selector for several declarative blocks within a single CSS file can affect the readability and maintainability of the code. It is also an optimization opportunity: by grouping these elements within a single rule, you will reduce the file size and optimize the rendering times.

The CSS Object Model (CSSOM)

The CSS rules allow to select elements from the HTML code in order to apply styling properties.

In order to do that, the browser constructs its own model of the CSS markup it has fetched: the CSS Object Model. This transformation takes several steps: reading the file, converting the strings of text into browser tokens, transforming these tokens into objects with properties and rules and organizing the elements in a tree-like model. These operations will take place more quickly if the CSS code is written in a simple and non-redundant way.

How to improve the CSS rules?

For maintenance as well as performance, you have to reduce the number of rules contained into your CSS files and group rules whenever it's possible. For instance, the following rules:

```
.myClass {
margin: 0;
}
...
.myClass {
border: 1px solid black;
}
```

Should be merged into a single one:

```
.myClass {
margin: 0;
border: 1px solid black;
}
```

If the duplication is the result of a legacy process or is justified for maintenance reasons, you can consider using a CSS minification tool able to do automatically this improvement.

Your Optimization Priorities

Add alt attribute on tags

#69

Moreover, the <u>alt</u> attribute is also an important criterion for SEO. Indeed, search engines crawlers cannot parse graphic contents. That is why they use the alternative text to return consistent results, like in Google images.

Example

The alt attribute is used in several cases unrelated to SEO:

- When a screen reader is in use for accessibility purposes;
- While image is loading, particularly for slow connections;
- When the image file is not found.

You have 52 img tags, but 43 tags are lacking an alt attribute:

-
-
-
- and 33 others

Warning, you should also note that 6 of your images contain an alt attribute, but they are empty:

-
- ullet
-
-
-
-

If nothing seems appropriate for describing an image, you might set an empty text. We advise you to make sure the majority of your images define a relevant text. Read the W3C recommendations here.

Your site doesn't use Open Graph properties

#2399

You can help social networks understand information related to the page by using Open Graph properties.

The Open Graph properties explained

Several properties allow social networks to learn more about the page's content. We recommend using at least the required properties:

This information is used to improve links between your page and various social networks, including Facebook. Read more about Open Graph here.

This page does not provide information to social networks.

Did you know?

#2457

This page contains 10 links

Two kind of links exist:

- Internal links that refer to pages with the same domain name;
- External links that point to other websites (must be relevant and point towards quality content).

If you reference many links, you can ask the SEO crawlers to consider only some of them, by adding the rel=nofollow attribute to the irrelevant ones (e.g., advertisements).

Here is the distribution of 10 links present in the page:

- 7 internal links (70,00%)
- 3 "follow" external links (30,00%)
- No "nofollow" external link (0,00%)

Well done, these best practices are respected

100/100

▼ This page defines <h1> and <h2> tags

#78

We recommend putting page keywords in at least the h1 and h2 tags. Search engines use the h1, h2, and h3 tags for SEO purposes.

This page contains:

- 1 <h1> element(s)
- 9 <h2> element(s)
- 1 <h3> element(s)

100/100

▼ This page uses only standard image formats

#81

The images that use a non-standard format may not be indexed by search engines.

Only these image formats are considered standard on the web: jpeg, jpg, png, gif, svg, ico, webp, avif. You should consider an alternative to any other format.

Moreover, remember to treat the text around your images: some search engines analyze approximately the 10 words preceding and following the image in order to add a context to the image.

▼ This page specifies a <title> tag

#83

The page should define a unique title (using a <title> tag).

Use of titles by search engines

Once properly configured, the page title can be displayed in the search engine results page:

Amazon.com: Online Shopping for Electronics, Apparel, Computers ...
https://www.amazon.com/ ▼ Traduire cette page
Online retailer of books, movies, music and games along with electronics, toys, apparel, sports, tools, groceries and general home and garden items. Region 1 ...

Using a suitable title is a major criterion for SEO. It allows you to control at best what is displayed in search results pages and determine the keywords you want your site pops out.

How to define the title of a web page?

The title of the page is specified into the <title> tag, which must be placed into the <head> tag, at the beginning of the code.

This page defines the title trough the title tag.

Here is the page's title:

The World's Worst Website Ever!

100/100

▼ You have defined a <meta> 'description'

#84

The page should define a unique description.

Description in search engines

The description of the page may be directly displayed in search engine results pages (SERP):

It allows you to control at best the entry preview in search engines, and to improve the click rate to your page. Learn more.

How to define a page's description?

Use <meta name="description" content="page description"> and place it in the <head> tag.

This page defines one <meta> description:

Welcome to the World's Worst Website Ever!

100/100

✓ You do not use query strings in the URL

#90

This URL does not contain any parameter.

A URL should be as readable as possible. For instance, $\frac{\text{http://example.com?userld=332\&group=MyGroup}}{\text{http://example.com/mygroup/me}} \text{ is less readable}$

The words are well separated in this URL

#2345

You should prefer the use of dashes in the URL.

URL and SEO

The words in the URL are among the many factors impacting the SEO: if you search the words web performance in a search engine, one criterion used by Google will be to check if the URL contains the words performance and web.

But for Google, underscores are not word separators: If your URL contains web_performance it will not help to highlight the page on the query web performance (web_performance is regarded as a unique word).

This behavior is however not common to all search engines. For example, Bing does not differentiate dashes and underscores.

Please note that Google does not penalize you for using an underscore in the URL.

How to resolve the issue?

We recommend using - instead of _ on your new web pages.

This is more complex fix the issue on existing web pages, such as the one analyzed here, because you can't just rename the URL (you will lose all your SEO efforts). It is then necessary to set up a permanent redirect (HTTP code 301) retaining the old URL, that forwards to the new URL. Beware: many redirects on your site can also affect the visibility of your web pages. So do not use redirects if the number of relevant pages remains limited.

This URL respects the tip.

100/100

▼ The page description has a right size

#2432

The page must have a description between 20 and 300 characters.

How the description is used by search engines

When properly configured, the page description can be found directly in the search results:

Amazon.com: Online Shopping for Electronics, Apparel, Computers ...

https://www.amazon.com/ Traduire cette page

Online retailer of books, movies, music and games along with electronics, toys, apparel, sports, tools, groceries and general home and garden items. Region $1\dots$

But search engines don't necessarily use the description you give them. If they think the description is irrelevant, they will use other criteria to present your page, and you will lose control over the displayed content. However, that you will not necessarily be penalized if your text is too large or too short. Learn more about how Google, for example, handles this topic.

How to define the description of a page?

The description of the page is provided by the <meta name="description" content="description of the page"> tag, which must be placed in the <heat> tag, at the beginning of the code, au début du code.

This page defines a <meta> description containing between 20 and 300 characters:

Welcome to the World's Worst Website Ever!

100/100

▼ Your <title> tag is an appropriate length

#2444

This page defines one title which contains less than 75 characters (see more information):

The World's Worst Website Ever!

The longer your title is, the more your chances are to see the search engines to truncate it or even to select another one from your page content.

✓ None of your titles are empty

#2467

<h1> , <h2> and <h3> tags should contain keywords related to the content.

The titles included on this page provide content.

100/100

✓ robots.txt file is well defined

#2503

Indicate to web crawlers which URLs should be explored on your website.

The robots.txt file

Place your robots.txt file in the root of the website. It will be interpreted by the robots in charge of your SEO. It delivers instructions to specify the pages to explore by robots, like Google bot.

Note that these directives are indicative only. A lambda robot will not be blocked by the restrictions specified by the file.

We detected a robots.txt file on this website.

100/100

The page handles the www redirect

#2507

Redirect https://theworldsworstwebsiteever.com/ to https://www.theworldsworstwebsiteever.com/ in order to avoid duplicate content.

What is the difference?

RewriteEngine On

Adding the "www" in front of a web address is a convention, that remains completely optional.

Some users are accustomed to access a website by adding www, and others do not. We advise you to deliver your content for these two addresses.

To avoid duplicate content issues with search engines, it is necessary to use a redirect (permanent) to point one of the addresses to the other.

You perform a 301 redirect from https://theworldsworstwebsiteever.com/ to https://www.theworldsworstwebsiteever.com/ .

You can configure a redirect thanks to your Apache server. Here is an example :

Tou can comigure a redirect thanks to your Apache server. Here is an example

RewriteCond %{HTTP_HOST} ^mywebsite.com

RewriteRule (.*) https://www.mywebsite.com\$1 [R=301,L]

The page is reachable both with and without "www" before the URL.

Your Optimization Priorities

0/100#2434

The Content Security Policy is missing

Protect your website from cross-site scripting (XSS) attacks by setting up a restrictive Content-Security-Policy.

XSS attacks explained

XSS attacks are a type of attack in which malicious data is maliciously added to websites. The number of vulnerabilities allowing these attacks is quite large, which is why it is as useful to prevent them as to limit their harmful effects.

You can protect your pages against these attacks and their effects by restricting execution to code portions either legitimized by the domain to which they belong or by a unique integrity token. The code that does not match this security policy will not be executed and the user will be informed.

You can learn more about XSS attacks on the Open Web Application Security Project (OWASP) Website.

Configure a "Content-Security-Policy" (CSP) HTTP header

Set up a "Content-Security-Policy" (CSP) HTTP header to prevent or limit the damage caused by an XSS attack. To specify a security policy configure your server so the response of the first resource contains the "Content-Security-Policy" HTTP header.

Here's an example:

Content-Security-Policy: script-src 'self' https://apis.google.com

Example

In this case, only scripts coming from the current host or https://apis.google.com will be executed.

Read more about the CSP HTTP header by consulting the CSP directives specification.

Please, be careful, if the header is misconfigured, some of your content, scripts, or styles may be blocked. That could cause unwanted side effects. Moreover, the restrictions apply to all pages of the website. We recommend you test the different pages of your website before deploying this header in your production environment.

CSP can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify your content security policy (in your .htaccess file, for example). Here is an example:

<iffModule mod_headers.c>
Header set Content-Security-Policy "script-src 'self' https://www.google.com"
</iffModule>

Examp

This example allows scripts from the same origin (same scheme, host and port) and google.com.

No Content Security Policy on this page: it is more easily exposed to XSS attacks.

This page is exposed to "clickjacking" type attacks

#2481

Keep malicious people from integrating your pages into their websites.

Clickjacking explained

This kind of attack happens when your page gets integrated with a malicious website via <frame> or <iframe> tags. By doing this, attackers can persuade users that they are on your own page when they are not. The unsuspecting user may enter personal information that is visible on and thus vulnerable to the malicious website.

To avoid this, always indicate which domains have permission to integrate your pages.

How to prevent clickjacking?

There are two main ways to prevent that behavior.

1/ Configure a "X-Frame-Options" HTTP header. Configure your server so the main resource response includes the "X-Frame-Options" HTTP header.

Three values may be defined:

- DENY to prevent any frame or iframe from integrating the page;
- SAMEORIGIN to authorize only frames from the same domain name;
- ALLOW-FROM uri to indicate the domains allowed to integrate a page into frame (however is not compatible with some browsers)

2/ Define an explicit frame-ancestors directive into a Content-Security-Policy HTTP Header. "frame-ancestors" directive is a newer, hence supported by fewer browsers, approach that will allow your website to authorize multiple domains instead of only the current origin. Setting this directive to 'none' is similar to X-Frame-Options: DENY .

Which approach to choose? If you only have the current domain to allow, do set up the two security features, for better compatibility with older browsers. If you want to allow multiple domains, you should only implement the frame-ancestors security policy.

The "X-Frame-Options" HTTP header can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify the header (in your .htaccess file, for example). Here is an example:

<IfModule mod_headers.c>
Header always set X-FRAME-OPTIONS "DENY"
</ifModule>

Exampl

Neither the "X-Frame-Options" HTTP header nor the "frame-ancestors" security police are configured on this page; you are more likely to be exposed to clickjacking.

0/100 #2492

1 iframe could be secure with a sandbox attribute

Restrict as much as possible the actions that can be processed by external content embedded on your website.

External contents

You should pay a special attention to external contents (social networks widgets, ads, etc.) embedded via the <iframe> tag. To limit the risks, the W3C has added the sandbox attribute in the HTML5 specifications. It restricts the available actions from an iframe (on major modern browsers).

How to fix the issue?

Add the sandbox attribute on your iframe tags to control as much as possible the behavior of its content. Be sure to use the correct values for this attribute.

A security policy is missing for the following iframe:

 <iframe width="560" height="315" src="https://www.youtube.com/embed/9bZkp7q19f0" frameborder="0" allow="accel erometer; autoplay; clipboard-write; encrypted-media; gyroscope; picture-in-picture" allowfullscreen>

The other tips

✓ Some third-party resources use auto detection of resource type

#2484

Protect yourself from malicious exploitation via MIME sniffing.

MIME-Type sniffing explained

Internet Explorer and Chrome browsers have a feature called "MIME-Type sniffing" that automatically detects a web resource's type. This means, for example, that a resource identified as an image can be read as a script if its content is a script.

This property allows a malicious person to send a file to your website to inject malicious code. We advise you to disable the MIME-Type sniffing to limit such activity.

Chrome has been working on a feature called <u>Site Isolation</u> which provides extensive mitigation against exploitation of these types of vulnerabilities. Site Isolation is more effective when MIME types are correct.

How to prevent MIME-Type sniffing

Configure a "X-Content-Type-Options" HTTP header. Add the "X-Content-Type-Options" HTTP header in the responses of each resource, associated to the "nosniff" value. It allows you to guard against such misinterpretations of your resources.

The "X-Content-Type-Options" HTTP header can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify the header (in your .htaccess file, for example). Here is an example:

<IfModule mod_headers.c>
Header always set X-Content-Type-Options "nosniff"
</ifModule>

Example

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

Did you know?

#2567

SSL Certificate

Your SSL certificate will expire on 04/10/2022. Update your certificate before that date.

What happens if my certificate expires?

Letting a certificate expire can have consequences for end users who will then see many error or alert messages while browsing the site, warning them of possible frauds, identity thefts or traffic interceptions. These alerts can have a very negative impact on the user's perception of the visited domain.

#2464

1 Your server should be able to communicate with HTTP while it uses a HTTPS connection

Take precautionary measures against attacks like "man in the middle" by making sure to only communicate in HTTPS with the server.

The HTTP Strict Transport Security (HSTS) Header

When you communicate with a server through a secure connection, every sent request towards this server should use the HTTPS protocol. The HTTP HSTS header allows to indicate to the browser that all the requests sent to the domain concerned must be done via HTTPS. If the URL is presented under "http://...", the web browser is automatically going to replace it by "https://...".

However, we advise you to not set this header unless your entire website serves its resources in HTTPS.

NSTS can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify your HSTS (in your .htaccess file, for example). Here is an example:

<IfModule mod_headers.c>
Header always set Strict-Transport-Security "max-age=63072000; includeSubDomains"

No HSTS header has been detected on this page.

#2474 1 21 resources on this page are for public use

By default, the browser accepts to perform AJAX requests, or to retrieve web fonts, only on the same domain name of the page. So a font provided by toto.com can only be used by the pages of toto.com. This prevents misuse of your resources by any site.

Some resources are public, and explicitly want to be available to everyone (eg Google Fonts). In this case, the HTTP header Access-Control-Allow-Origin can be used with the value "*". You should, however, use this property if your resource has aimed to be used by the greatest number. Otherwise, we recommend that you keep the default, or set a specific domain name in the "Access-Control-Allow-Origin" HTTP header.

You should be aware of the following resources, that use a Access-Control-Allow-Origin: * HTTP header. Make sure they are actually intended to be used by pages from all domain names:

It appears these files are hosted by a third-party, so they may not be within your control. However, you should consider any alternative to these resources to improve your page performance.

- and 6 others

1 3 cookies are not secure

A cookie sent from the server to a web browser via the HTTPS protocol should only transits on a secure connection (except for some specific cases).

HTTP cookies

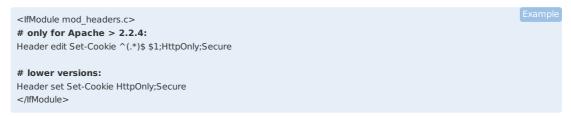

HTTP cookies are set by the server to the web browser via the Set-Cookie HTTP header. Then, the browser transmits the cookies to the server for the next requests by using the Cookie HTTP header. When the server uses a secure connection (HTTPS), the cookie probably contains some sensitive data: you have to guarantee that the cookie cannot be exploited on an insecure connection.

The Secure directive

By adding the Secure instruction in the Set-Cookie HTTP header, the server informs the browser that it is allowed to transmit the cookie over secure connection only.

Caution: Ensure that the HTTP to HTTPS redirect is activated on your website. Otherwise, the Secure cookie may not be sent on HTTP request.

The Set-Cookie HTTP header can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify the header (in your .htaccess file, for example). Here is an example:

The following Cookies are not secure:

beacon.walmart.com/etap.gif?tap=gAds&google_gid=[...]Aueg2JCxag_3UJxV7mtx4S_A

- set-cookie: btc=dlBavciUpacvUOh2tDLi6k;Path=/;Expires=Wed, 17 Mar 2032 15:40:08 GMT;Max-Age=315576000
- set-cookie: bsc=dlBavciUpacvUOh2tDLi6k;Path=/
- set-cookie: b30msc=dlBavciUpacvUOh2tDLi6k;Path=/;Expires=Fri, 18 Mar 2022 04:10:08 GMT;Max-Age=1800

Shared infrastructure cookies

With some hosting providers, especially on shared infrastructures, cookies may be set without any control on your part. The information they contain is usually not sensitive. You can check this and ignore this warning if that applies to you.

#2526 **[]** Do target="_blank" links introduce a security leak on this page?

Using the target="_blank" attribute is rarely recommended. Nevertheless, if you need to use this attribute, note that a security leak could cause harm to your visitors, particularly if your site is open to visitor contributions.

It allows the targeted page to manipulate the window.opener.location property, and thus to perform a redirect within the parent tab. When the user gets back to the parent tab, he can be facing a malicious website (phishing, etc.).

Even without being malicious, a website opened via a target="_blank" link can degrade the performance of the site that opened it, because most browsers share the same thread between source and target websites.

We recommend you to add the rel=noreferrer attribute when using a target = _blank to an external website. This will block access to "window.opener".

If your website allows users to publish contributive content (eg comments, customer reviews, etc.), be sure to automate the addition of this protection. Otherwise, a user could easily exploit this breach.

The following links may be exposed to this vulnerability:

- here is a link
- @worldsworstweb

11 14 cookies may be corrupted on the client side

A cookie must be manipulated on the server side. It is not recommended to use it on the browser.

HTTP cookies

HTTP cookies are set by the server to the web browser via the Set-Cookie HTTP header. Then, the browser transmits the cookies to the server during the following requests by using the Cookie HTTP header.

You should ensure that the cookie cannot be exploited on the client side.

The HttpOnly directive

By adding the HttpOnly instruction in the Set-Cookie HTTP header, the server informs the browser that it is not allowed to manipulate the cookie. The client side can only get and return the cookie sent by the server: the cookie only transit on the HTTP protocol but can not be updated via JavaScript for example.

The Set-Cookie HTTP header can be configured with your Apache server. Make sure that the mod_headers module is enabled. Then, you can specify the header (in your .htaccess file, for example). Here is an example:

<IfModule mod_headers.c>
only for Apache > 2.2.4:
Header edit Set-Cookie ^(.*)\$ \$1;HttpOnly;Secure

lower versions:
Header set Set-Cookie HttpOnly;Secure

Some HTTP cookies could be exploited during a XSS attack. You should consider adding the HttpOnly directive for additional security:

#2553

1 Do all third-party resources deliver the right content?

If this page loads resources from third parties, you should ensure their integrity.

SubResource Integrity (SRI)

Use SRI to ensure that a third-party resource has not been tampered. Add the integrity attribute to <script and clink tags loading this kind of resource. Example:

```
<script src="https://exemple.com/exemple-framework.js"
integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGYl1kPzQho1wx4JwY8wC"
crossorigin="anonymous">
</script>
```

The integrity attribute value is equal to the base64-encoded hash (SHA) of the resource. The browser compares this hash with the downloaded content in order to determine if the resource matches the expected content.

You can create the SHA thanks to several tool. In command line, you can use openssl. You can also test some online tools, as srihash.org or report-uri.io. Learn more about SubResource Integrity.

Well done, these best practices are respected

100/100

▼ This page only uses secure content

#2397

This page was transmitted over the HTTPS protocol, and all resources are fetched using the HTTPS protocol. So there is no Mixed Content vulnerability.

100/100

The secure version is used systematically

#2509

Users using the HTTP version of the page must be redirected to the secure version.

HTTPs redirect

Even if a page is secure, visitors may still use the HTTP version (via an external link, or because they have bookmarked the HTTP version of the page, for example). Always set up a redirection so that users accessing the page using the HTTP protocol are redirected to a secure version.

Nan Apache server can be configured to rewrite HTTP URLs.

Your users are automatically redirected to the secure version of the page.

Well done, these best practices are respected

Your Apache server version is not exposed

#74

You are using Apache, but we are not able to detect the version. It is more difficult for a hacker to attack your website, because he does not know the version you use. This is a good practice.

There are two values to check if you want to hide your server version: the ServerSignature and the ServerTokens (/etc/apache2/conf.d/security file on a Linux server).

However, keep in mind that the best way to protect your system from attacks is to regularly update your Apache server.
